SUMMARY

Computer Science and AI student building model-training pipelines, held-out evaluations, and full-stack AI workflows. Seeking an AI engineering internship to contribute Python/ML skills and end-to-end product engineering.

EDUCATION

Newton School of Technology at Rishihood University

2024-2028

B.Tech in Computer Science and Artificial Intelligence

CGPA: 9.28/10

Minor in Finance

TECHNICAL SKILLS

Languages: Python, TypeScript, JavaScript, SQL

ML & Data: scikit-learn, pandas, NumPy, TF-IDF, logistic regression, SHAP, model evaluation, data preprocessing, exploratory data analysis, Tableau

AI & Backend: OpenAI SDK, FastAPI, Pydantic, Zod, PostgreSQL, Prisma, Redis, BullMQ

Web & Tools: React, Next.js, Express, REST APIs, Git/GitHub

PROJECTS

TruthLens — NLP Classification & Model Evaluation

Solo project · [GitHub](#) · [Live](#)

- Built a misinformation-classification experiment using TF-IDF and logistic regression; corrected ISOT label provenance before retraining.
- Evaluated on held-out LIAR data: F1 **0.5648** against a **0.75** release gate. Rejected the artifact rather than uploading or activating an unsupported model.
- Implemented SHAP token-contribution explanations, drift checks, and fail-closed serving when no valid baseline is available; kept explanations distinct from factual verification.

FeedbackOS — LLM-Assisted Feedback Triage

Solo project · [GitHub](#) · [Live](#)

- Built an end-to-end prototype that ingests feedback and classifies theme, sentiment, and product area for filtered review and aggregate trend views.
- Separated ingestion from classification with BullMQ workers and bounded concurrency; validated structured model output with Zod and included a low-confidence review path.
- Implemented capped CSV ingestion and organization-scoped cached summaries to keep input handling and dashboard data boundaries explicit.

Beijing PM2.5 — Data Preparation & Exploratory Analysis

Six-person coursework · Project, data & ETL lead · [GitHub](#) · [Live](#)

- Led data sourcing for a six-person coursework project covering **43,824 hourly observations** from Beijing, 2010–2014.
- Built the pandas ETL and cleaning workflow to prepare the hourly dataset for downstream analysis and visualization.
- Supported exploratory analysis, seasonal and hourly views, Tableau work, and reporting while teammates led analysis and visualization.
