SUMMARY

Computer Science and AI student building web applications from interface to API, database, and background workers. Seeking a full-stack engineering internship to contribute TypeScript, React, and backend skills, with particular attention to validation, data boundaries, and failure states.

EDUCATION

Newton School of Technology at Rishihood University

2024-2028

B.Tech in Computer Science and Artificial Intelligence

CGPA: 9.28/10

Minor in Finance

TECHNICAL SKILLS

Languages: TypeScript, JavaScript, Python, SQL

Frontend: React, Next.js, Tailwind CSS, HTML, CSS

Backend & Data: Node.js, Express, REST APIs, PostgreSQL, Prisma, Redis, BullMQ

Web & Tools: NextAuth, JWT, Zod, OpenAI SDK, Git/GitHub

PROJECTS

FeedbackOS - Feedback Triage & Background Processing

Solo project · [GitHub](#) · [Live](#)

- Built a Next.js/TypeScript prototype for feedback ingestion, filtered review, and aggregate trends, backed by Prisma and PostgreSQL.
- Separated classification from ingestion with Redis/BullMQ workers and bounded concurrency; validated OpenAI output with Zod and kept low-confidence results reviewable.
- Implemented organization-scoped cached summaries, capped CSV ingestion, and AES-256-GCM integration-credential storage; included authentication with NextAuth.

MedMarket - Role-Aware Medicine Marketplace

Solo project · [GitHub](#) · [Live](#)

- Built consumer, pharmacy-owner, and admin workflows with React and an Express/TypeScript REST API, using Prisma and PostgreSQL for persistence.
- Implemented JWT authentication, role-aware routes, and controller-level OTC/MRP rules; kept catalogue and pricing decisions outside AI extraction.
- Added tiered expiry notifications and document-extraction workflows with explicit unreadable/fallback states and human verification rather than treating AI output as authoritative.

RouteLens - API Directory & Structural JSON Comparison

Solo project · [GitHub](#) · [Live](#)

- Built a browser-based Next.js/TypeScript tool that imports OpenAPI/Swagger JSON or YAML and hand-entered routes into a searchable API directory.
- Implemented guarded browser persistence, route deduplication by project/method/path, and defensive internal-reference resolution that reports external or circular references.
- Built structural JSON comparison with identity-key matching for suitable arrays and positional fallback otherwise; completed the project for a Digital Heroes internship qualifying round, not employment.
